                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δ
        The present sequence is that of cDNA encoding the short isoform of novel human potassium channel Kv4.3. 2 Isoforms of human Kv4.3 have been identified. One form is full-length (hKv4.3 long) while the second form has a deletion of 19 amino acids in the carboxy domain after the predicted sixth transmembrane domain (hKv4.3 short). Human heart primarily expresses hKv4.3 long, whereas human brain contains both forms. To obtain the present hKv4.3 short cDNA, PCR amplification was performed using primers that flanked the 57 bp insert in hKv4.3 long. The invention provides Kv4.3 polypeptides, polynucleotides, and methods for producing these polynucleotides. The Kv4.3 polypeptides and polynucleotides are
                                                                                                                                                                                                                                                                      New isolated polynucleotide encoding human Kv4.3 potassium channel polypeptide, useful as probe in a diagnostic method for detecting acid encoding human Kv4.3, and for treating Alzheimer's and heart
                                                                                                                                                                                                                  Claim 7; Col
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             US6395477-B1
                                                                                                                                                                                                                                                                                                                                                                                                        Cockett

                                                    This cDNA sequence codes for human Kv potassium channel hKv4.3 (see AAW79590). It shows about 92% identity in 1932 nucleotides to rat Kv4.3. A 1914 bp fragment corresponding to hhKv4.3 full-length cDNA was isolated from human heart cDNA by PCR amplification (see AAV61574-77). Another claimed polynucleotide (see AAV61571) encodes an isoform (see AAW79589) of hKv4.3 having 19 fewer amino acid residues. The invention relates to these hKv4.3 polynucleotides and polypeptides and to methods for producing such polypeptides by recombinant techniques. Also claimed are methods for utilising the hKv4.3 polynucleotides for the treatment of subjects in need of enhanced or reduced activity or expression of hKv4.3 polypeptide. These include the treatment of cardiac arrhythmias and Alzheimer's disease. The invention can also be used to identify agonists and antagonists of hKv4.3, and to detect disease associated with inappropriate hKv4.3 expression or activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo

                                                                                                                                                             망
                                                                                                                                                                                         ঠ
                                                                                                                                                                                                                                                                                                                        The invention relates to a nematode worm that expresses a heterologous nucleotide sequence encoding a functional voltage-gated potassium channel of the Kv4 family, or its analog, mutant, variant, homolog, ortholog, part or fragment. The nematode worm is useful in determining whether a compound interacts with the voltage-gated potassium channel of the Kv4 family or whether a compound is an agonist, antagonist, opener and/or blocker of the voltage-gated potassium channel expressed by the nematode worm. The methods are used for identifying and developing compounds that cinteract with voltage-gated potassium channels of the Kv4 family. The compounds may be used in the development and/or preparation of compositions for pharmaceutical, agrochemical and/or veterinary use. These may be used in preparing compositions for preventing or treating diseases or conditions such as arrhythmia, tachycardia, congestive heart failure, epilepsy, stroke, traumatic brain injury, anxiety, insomnia, carrescents will-type have a conditions of sisease. The current sequence

```
This cDNA sequence codes for human Kv potassium channel hKv4.3 (see AAW79589). It shows about 92% identity in 1913 nucleotides to rat Kv4.3. A 1914 bp fragment corresponding to hKv4.3 full-length cDNA was isolated from human heart cDNA by PCR amplification (see AAV61574-77). Another claimed polynucleotide (see AAV61572) encodes an isoform (see AAW79590) of hKv4.3 having an additional 19 amino acids. The invention relates to these hKv4.3 polynucleotides and polypeptides and to methods for producing such polypeptides by recombinant techniques. Also claimed are methods for utilising the hKv4.3 polynucleotides for the treatment of subjects in need of enhanced or reduced activity or expression of hKv4.3 polypeptide. These include the treatment of cardiac arrhythmias and Alzheimer's disease. The invention can also be used to identify agonists and antagonists of hKv4.3 and to detect disease associated with inappropriate hKv4.3 expression or activity
                                                                                                                                                                                                                                                                                                                                                                                                                      New potassium channel polypeptides, hKv4.3 poly:nucleotide(s) useful in the treatment arrhythmias and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bril AMA, Calmels TPG,

This cDNA sequence codes for human Kv potassium channel hKv4.3 (see AAW79591). It was isolated using expressed sequence tag analysis. The sequence has about 91% identity in 1914 nucleotide residues with rat Kv4.3 potassium channel. Full-length hKv4.3 cDNA clones (see AAV61571-72) are also claimed. The invention relates to hKv4.3 polynucleotides and

Also claimed are methods for utilising hKv4.3 recombinant techniques. Also claimed are methods for utilising hKv4.3 polynucleotides for the treatment of subjects in need of enhanced or reduced activity or expression of hKv4.3 polypeptide. These include the treatment of cardiac arrhythmias and Alzheimer's disease. The invention can also be used to identify agonists and antagonists of hKv4.3, and to detect disease associated with inappropriate hKv4.3 expression or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        / Match

                                                                                                                                                                                                                                                                                                       This invention describes a novel potassium channel protein (I) that is either human Kv4.1 or Kv4.2. Eukaryotic cells that express potassium channels containing (I) are used to identify and test: (i) compounds for treatment of neurodegenerative diseases (autism, epilepsy, ischemia, stroke; Alzheimer's, Parkinson's and Huntington's diseases) or cardiac arrhythmia, or those that improve learning capacity and memory; and (ii) activators of protein kinases. Host cells that express (I) can identify agents that do not interact significantly with channels and control I to (a quickly activated transient current), so lack the side effects of known anti-arrhythmic agents. They also eliminate, or reduce, the need for testing on organ cultures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo

to detecting the presence of an ovarian cancer in a patient by stimulating and/or expanding T cells specific for the tumour protein. products of the invention can also be used in a method to inhibit the development of a cancer in a patient comprising (a) incubating CD4+ and/or CD8+ T cells isolated from a patient with at least one ovarian tumour protein, such that T cell proliferate and (b) administering to patient the proliferated T cells. The cytostatic polynucleotides or polypeptides described in the invention are useful for treating or inhibiting the development of cancer, particularly ovarian cancer and stimulating and/or expanding T cells specific for a tumour protein or Sequence gene therapy. This invention describes a novel ovarian tumour protein which to detecting the presence of an ovarian cancer in a patient by 2351 B₽; 572 A; 606 ü 591 G; 582 T; 0 U; 0 Other; can be used for The the

This invention relates to novel isolated polynucleotides and methods fithe therapy and diagnosis of cancer, particularly ovarian cancer. Specifically, it refers to these polynucleotides and the encoded polypeptides thereof, as well as immunogenic peptides, antibodies, antigen presenting cells (APCs) and immune system cells (e.g. T cells) that are targeted to those cells expressing the proteins of interest. The present invention describes methods that are useful for stimulating and or expanding T cells specific for a tumourigenic protein (i.e. T cells)

Furthermore, compositions can be used for the diagnosis, treatment and/ or prevention of ovarian cancer by stimulating an immune response in a patient. Accordingly, these compositions exhibit cytostatic activity. This polynucleotide is a human ovarian tumour antigen DNA sequence given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 2351 BP; 572 A; 606 C; 591 G; 582 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to detecting the presence of an ovarian cancer in a patient by stimulating and/or expanding T cells specific for the tumour protein. products of the invention can also be used in a method to inhibit the development of a cancer in a patient comprising (a) incubating CD4+ and/or CD8+ T cells isolated from a patient with at least one ovarian tumour protein, such that T cell proliferate and (b) administering to patient the proliferated T cells. The cytostatic polynucleotides or polypeptides described in the invention are useful for treating or inhibiting the development of cancer, particularly ovarian cancer and stimulating and/or expanding T cells specific for a tumour protein or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel ovarian tumour protein which can be u to detecting the presence of an ovarian cancer in a patient by stimulating and/or expanding T cells specific for the tumour protein. products of the invention can also be used in a method to inhibit the development of a cancer in a patient comprising (a) incubating CD4+ and/or CD8+ T cells isolated from a patient with at least one ovarian tumour protein, such that T cell proliferate and (b) administering to patient the proliferated T cells. The cytostatic polynucleotides or polypeptides described in the invention are useful for treating or inhibiting the development of cancer, particularly ovarian cancer and stimulating and/or expanding T cells specific for a tumour protein or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotides encoding tumor proteins, treating or inhibiting the development of cancer, particularly ovarian cancer, and for stimulating and/or expanding T cells specific for a tumor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         14-NOV-2000; 2000US-00713550.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to novel isolated polynucleotides and methods for the therapy and diagnosis of cancer, particularly ovarian cancer. Specifically, it refers to these polynucleotides and the encoded polypeptides thereof, as well as immunogenic peptides, antibodies, antigen presenting cells (APCs) and immune system cells (e.g. T cells) that are targeted to those cells expressing the proteins of interest. The present invention describes methods that are useful for stimulating and/ or expanding T cells specific for a tumourigenic protein (i.e. T cell therapy). Furthermore, compositions can be used for the diagnosis, treatment and/ or prevention of ovarian cancer by stimulating an immune response in a patient. Accordingly, these compositions exhibit cytostatic activity. This polynucleotide is a human ovarian tumour antigen DNA sequence given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated ovarian polypeptide, useful as in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 5333 BP; 1510 A; 1136 C; 1167 G; 1520 T; 0 U; 0 Other;

This invention relates to novel isolated polynucleotides and methods for the therapy and diagnosis of cancer, particularly ovarian cancer. Specifically, it refers to these polynucleotides and the encoded polypeptides thereof, as well as immunogenic peptides, antibodies, antigen presenting cells (APCs) and immune system cells (e.g. T cells) that are targeted to those cells expressing the proteins of interest. present invention describes methods that are useful for stimulating any

Furthermore, compositions can be used for the diagnosis, treatment and/ or prevention of ovarian cancer by stimulating an immune response in a patient. Accordingly, these compositions exhibit cytostatic activity. This polynucleotide is a human ovarian tumour antigen DNA sequence given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                          1499

                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated polynucleotide. The invention is used to diagnose, prevent or treat cancer, particularly ovarian cancer.

The present sequence represents a human ovarian carcinoma cDNA homologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide encoding an ovarian tumor protein for diagnosing, preventing or treating cancer, particularly ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2004-051070/05.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB
